

Where is the app which can help you and your friends find out, and when you've ever wondered,

Where Should We Eat?

For when you all live in different places, have you ever wondered where is a good place to eat which is fair for everyone in terms of distance travelled, petrol consumed or cab expenses?

Our app solves this problem, by having the users input where they live, or where they might want to go (yes we're flexible that way!). We perform a search finding food places using the API provided by Yelp which are in the middle of where everyone is, and provide these results to them.

This saves the trouble of eating in a place which is close-by for most people, but quite far for one guy. Apart from finding a place that wouldn't be too far for anyone, we also provide them with the approximate taxi fare that one would have to pay to get there. This would be useful particularly for the buddies who are wanting to go for supper late into the night, and want to minimize the taxi fares everyone has to pay.

We even save a history of previous adventures so users know where, when and who they went with. They can save the postal codes in an intuitive contacts list for easy access in the future, such as "John (home)", or "Mary (school)".

The app's cloud capabilities rely heavily on Google Maps and GeoLocation services to achieve this. We don't, however, depend on GeoLocation services provided by the mobile. That's because we're aiming at finding a place which is at the mid-point for when people are going home or anywhere else they want to go, not necessarily a place which is close by to where people are now.

Current apps provide the latter capability very well, but we believe that we are unique in providing a well-packaged interface that envelops a specially designed app for specific needs, that is, finding the best places to eat that is central to where everyone lives or wishes to go next after the outing.
